Applicant: Rosario Maggio et al.  
Title: DEVICE FOR OPENING AND DISTRIBUTING A  
BUNDLE OF FILAMENTS WHEN PRODUCING A  
NONWOVEN TEXTILE WEB  
Docket No.: 34051

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents  
Washington, D.C. 20231

Sir:

Prior to the examination of the above-identified patent application, it is requested that the following amendments be made.

IN THE CLAIMS:

Please cancel claims 1- 4 without prejudice.

Please add the following claims 5 - 11.

- 1 5. (new) A device for opening and distributing a
- 2 bundle of drawn filaments to be formed into a nonwoven
- 3 textile web deposited on a movable receiving belt, said
- 4 device comprising an assembly through which said
- 5 filaments pass before being deposited on the receiving
- 6 belt, said bundle of drawn filaments being disposed in a
- 7 curtain configuration and having a bundle width, said
- 8 assembly including a diffuser having an inlet zone formed
- 9 by a convergent nozzle extending along the entire bundle
- 10 width for receiving filaments, a divergent nozzle

11 connected to said convergent nozzle for receiving  
12 filaments from the latter, and a rail for  
13 electrostatically charging said filaments before they are  
14 deposited on said receiving belt.

1 6. (new) A device according to claim 5, wherein  
2 said convergent nozzle is connected to said divergent  
3 nozzle by a rectilinear slot and said rail is mounted  
4 within said rectilinear slot immediately upstream of said  
5 divergent nozzle.

1 7. (new) A device according to claim 5, wherein  
2 said bundle of filaments is emitted from a drawing slot  
3 positioned upstream of said inlet zone and an intake flow  
4 of air is provided at the inlet zone by a venturi effect  
5 produced in the divergent nozzle by air passing  
6 therethrough with said filaments.

1 8. (new) A device according to claim 7, wherein air  
2 is injected into said diffuser and passes from said  
3 diffuser through said divergent nozzle.

1 9. (new) A device according to claim 5, wherein  
2 said convergent nozzle includes a pair of converging  
3 walls and said divergent nozzle includes a pair of  
4 diverging walls.

1           10. (new) A device according to claim 6, wherein  
2   said bundle of filaments is emitted from a drawing slot  
3   positioned upstream of said inlet zone and an intake flow  
4   of air is provided at the inlet zone by a venturi effect  
5   produced in the divergent nozzle by air passing  
6   therethrough with said filaments.

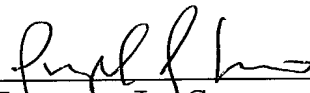

1            11. (new)    A device according to claim 10, wherein  
2    air is injected into said diffuser and passes from said  
3    diffuser through said divergent nozzle.

REMARKS

Attached hereto is a page entitled "VERSION WITH  
MARKINGS TO SHOW CHANGES MADE".

If there are any further fees required by this  
amendment not covered by an enclosed check, or if no  
check is enclosed, please charge the same to Deposit  
Account No. 16-0820, Order No. 34051.

Respectfully submitted,

By:   
Joseph J. Corso, Reg. No. 25845

DEVICE FOR OPENING AND DISTRIBUTING A BUNDLE OF FILAMENTS  
DURING THE PRODUCTION OF A NONWOVEN TEXTILE WEB

Technical field

5       The invention relates to an improvement made to the installations for making a nonwoven textile web, which is commonly referred to by the generic name of spunbond and which is formed by continuous synthetic filaments.

10       It concerns more particularly an improvement made to the means for distributing the extruded filaments, after drawing, over a movable transporting belt, over which they are randomly distributed so as to form a regular web, with a weight and thickness which can be adjusted according to  
15 the applications.

Prior art

The production of nonwoven webs of the spunbond type goes back decades and consist, generally speaking:

- 20       - in extruding a melted organic polymer through a spinneret perforated with holes, so as to form a bundle or curtain of filaments;  
- then, in orienting the extruded filaments by drawing by means of one or more fluid-jet, in particular compressed-air, devices,  
25       - and finally, in receiving the bundle of filaments in the form of a web on a movable transporting belt, which is generally subjected to a suction source and the speed of which is adjusted  
30 according to the characteristics of the web, in particular thickness, which it is desired to achieve.

After production, the web is consolidated, for example  
35 by performing a sizing or calendering, preferably hot calendering, so that the elementary filaments are joined to one another.

5

10

- 15

30

35

In order to obtain a nonwoven web as homogeneous as possible on the receiving belt onto which the filaments leaving the drawing slot are projected, it is necessary not

## 35

Now, it has been found, and this forms the subject of the invention, that it was possible to achieve not only a

perfect opening of the bundle of extruded filaments at the outlet of the drawing slot, but also a very homogeneous distribution over the receiving belt, on the one hand by separating the assembly for opening the bundle of filaments from the actual drawing slot, and on the other hand and above all, by designing this opening assembly such that it combines both the advantages of the techniques of electrostatically charging the filaments and the techniques of opening the bundle by slowing down the air speed at the drawing-slot outlet, and thus the speed of the filaments before reception on the receiving belt.

Generally speaking, the invention thus relates to a device for opening and distributing a bundle of filaments during the production of a nonwoven textile web, according to the technique which consists:

- in extruding a melted organic polymer through a spinneret perforated with holes, so as to form a bundle or curtain of filaments;
- then, in orienting the extruded filaments by drawing by means of one or more fluid-jet devices;
- and finally, in receiving the bundle of filaments in the form of a web on a movable transporting belt below which is arranged a suction source.

The device for opening and distributing the bundle of filaments according to the invention consists of an assembly arranged downstream of the outlet of the drawing assembly and separated therefrom, this assembly comprising, arranged closed to the outlet of the drawing slot, a diffuser comprising an inlet zone in the form of a convergent nozzle extending over the entire width of the installation opposite the outlet of the drawing slot for producing the web, extended by a divergent nozzle, the said assembly being associated with a rail electrostatically

charging the filaments before they are received on the receiving belt.

According to one embodiment, the divergent zone of the diffuser comprises two walls and two lateral slots situated at the top of the said diffuser, on each side thereof, and permitting either an indraught of air from outside owing to the venturi effect, or, where appropriate, an injection of air under a pressure less than one bar and advantageously between 0.4 and 0.8 bar, bringing about an air flow against the walls of the said diffuser.

The above diffuser makes it possible to precisely adjust the width of the bundle of fibres and also the impact speed of the filaments on the receiving belt, the electrostatic charging assembly being able to be situated, where appropriate, downstream of the diffuser assembly, but preferably being integrated inside the latter, thereby accentuating the opening of the bundle of filaments.

20

Advantageously and in practice:

- the diffuser comprises an inlet zone in the form of a convergent nozzle connected to the two walls of the divergent zone by a rectilinear slot, the rail electrostatically charging the filaments being mounted at the level of the rectilinear slot immediately upstream of the divergent zone;
- the distance of the diffuser from the receiving belt is adjustable, in order to minimise the influence of the outside air currents on the bundle of fibres;
- the pressure of the air which flows in the diffuser against the walls thereof and the adjustment of the voltage applied in the electrostatic rail makes it possible to adapt very precisely the conditions of the formation of the sheet according to the speed of the filaments

35

Generally speaking, as can be seen from Figure 1, such an installation is thus composed essentially of at least one extruder, designated by the general reference (1), which feeds synthetic polymer, such as polyamide, polyethylene, polyester, etc., to a spinneret (2) for the formation of a curtain of filaments (3)

From a practical point of view, by way of guidance, the spinneret consists of a plate each containing a multitude of holes, for example 5000 per metre of width and having a diameter depending on the extruded filaments, for example of 0.5 mm. These holes are distributed over a plurality of parallel rows, for example over eighteen rows, and over a width at the spinneret outlet of 140 mm.

25

30

35

Such a drawing system makes it possible to bring about the suction of the curtain of filaments and its entrainment by high-speed air streams for effecting the drawing.

5        At the outlet of the drawing assembly (5), the bundle of filaments (3) is projected onto the receiving belt (7) by way of an assembly (6), which assembly forms the subject of the invention and the two embodiments of which can be seen in Figures 2 and 3, and which causes the air flow  
10 leaving the slot (5) to deviate and slow down, thus bringing about the opening of the bundle of filaments.

In the first embodiment illustrated in Figure 2, such an assembly comprises, close to the outlet of the drawing  
15 slot (F) of the assembly (5), on the one hand, a diffuser, designated by the general reference (10), consisting essentially of a divergent nozzle which extends over the entire width the production of the web and, on the other hand, downstream of this opening assembly, a rail (11) for  
20 electrostatically charging the filaments at the outlet of the assembly (10), bringing about an opening at the heart of the said bundle of filaments before they are deposited on the receiving belt (7).

25        In this embodiment, the diffuser assembly (10) is composed essentially of a chamber (12) having an inner slot (13) in the form of a convergent/divergent nozzle extending over the entire width of the installation opposite the outlet of the drawing slot (F) of the assembly (5).

30        Opening into this slot (13), close to the lower part of the divergent zone, are two laterally arranged symmetrical slots (14). These symmetrical slots (14) may be either connected to a source of compressed air injected  
35 under a pressure less than 1 bar and advantageously of the order of 0.4 bar, or be simply open to the outside air.

The divergent zone is, in this embodiment, extended by two walls (15) which are likewise divergent.

Arranged immediately downstream of this diffuser assembly, or where appropriate integrated inside the latter, is a conventional rail (11) for electrostatically charging the filaments, thus making it possible to intensify the opening of the bundle. Such a rail (1) is a conventional rail, for example of the type described in US-A-3 967 118.

Figure 3 illustrates a second embodiment of an assembly for opening and distributing a bundle of filaments in the form of a web produced in accordance with the invention.

In this variant, using the same references as those employed to describe the example illustrated by Figure 2, the device for opening and distributing the bundle of filaments (6) is, as before, separated from the drawing assembly (5).

This embodiment also comprises an inlet zone (13) in the form of a convergent nozzle extending opposite the outlet of the drawing slot (F). This inlet zone (13) in the form of a convergent nozzle is connected to the two walls (15) of the divergent zone by a rectilinear slot (20).

The rail (11) for electrostatically charging the filaments is, in this embodiment, integrated inside the diffuser, at the end of the rectilinear slot (20) immediately upstream of the divergent zone (15).

An indraught of air coming from outside owing to the venturi effect is produced through the two adjacent lateral slots formed by the lower face of the drawing assembly (5)

Of course, the invention is not limited to such an embodiment, but covers any variants thereof realised in the same spirit.

CLAIMS

1. Device for opening and distributing a bundle of filaments during the production of a nonwoven textile web, according to the technique which consists:

- in extruding a melted organic polymer through a spinneret perforated with holes, so as to form a bundle or curtain of filaments;
- then, in orienting the extruded filaments by drawing by means of one or more fluid-jet devices (5);
- and finally, in receiving the bundle of filaments in the form of a web on a movable receiving belt below which is arranged a suction source,

characterised in that it consists of an assembly (6) arranged downstream of the outlet of the drawing assembly (5) and separated therefrom, the said assembly comprising, arranged close to the outlet of the drawing slot (F), a diffuser (10) comprising an inlet zone (13) in the form of a convergent nozzle extending over the entire width of the installation opposite the outlet of the drawing slot (F) for producing the web, extended by a divergent nozzle (15), the said assembly being associated with a rail (11) electrostatically charging the filaments before they are received on the receiving belt (7).

2. Device according to Claim 1, characterised in that the diffuser (10) comprises an inlet zone (13) in the form of a convergent nozzle connected to the two walls (15) of the divergent zone by a rectilinear slot (20), the rail (11) electrostatically charging the filaments being mounted at the level of the rectilinear slot immediately upstream of the divergent zone (15).

3. Device according to one of Claims 1 and 2, characterised in that an indraught of air owing to the venturi effect is produced between the faces opposite the

[illegible]

The invention concerns a device for opening and distributing a bundle of filaments when producing a nonwoven textile web by a technique which consists in : extruding melted organic polymer through a die perforated with holes, so as to form a bundle or curtain of filaments; then directing the extruded filaments by drawing by means of one or several fluid jets ; and finally, receiving the bundle of filaments in the form of a web on a mobile conveyor belt. The invention is characterised in that it consists of an assembly arranged downstream of the outlet of the drawing assembly and separate therefrom, said assembly comprising, arranged in the proximity of the drawing slot outlet, a diffuser comprising an intake zone shaped as a convergent nozzle extending over the whole width of the installation opposite the drawing slot outlet producing the web, extended by a divergent nozzle, said assembly being associated with a ramp electrostatically charging the filaments before they are received on the receiving belt.
